

Abstract

The invention relates to a device for treating the temporomandibular joint with a respective pad (5) for placing on the occlusal surfaces of the posterior teeth (Z) of the left-hand and right-hand sides, the pads (5) being formed by an envelope produced from a flexible material, which is filled with fluid (F), and the two pads (5) being connected to each other by means of a tube (7) for fluid exchange. To improve the wearing comfort, it is proposed according to the invention that each pad (5) has on one side of it a means (1, 3, 4, 8) for clamping on the posterior tooth (Z).
